EXPERIENCE

Zomato (Nugget)

Dec 2025 – Present

Software Engineer

- **Owned the Avatar voice configuration platform** powering production AI voice calls, consolidating TTS/STT providers, models, voices, volume, compliance messages, background noise, and client-specific pronunciation dictionaries into a unified backend; integrated providers including **Sarvam, ElevenLabs, Cartesia, and Groq**.
- Built a **Fallback STT** mechanism for Indian-language transcription failures, automatically switching to a secondary transcriber when the primary provider failed; **eliminated ~95% of call drops caused by transcription failures** and made the fallback configurable per client.
- Redesigned voice management from developer-driven to **client-driven voice addition**, separating shared client-agnostic voices from client-specific voices; **reducing per-client voice DB entries by ~70%**.
- Reduced real-time AI response latency by **parallelizing Knowledge Base retrieval with workflow execution** and introducing result classification to select the better response, **cutting response time from ~3s to ~1s** and avoiding wasted computation from cancelled turns.
- Built and rolled out a **QC Ticket Dashboard for ~200 clients**, extending existing ticketing architecture with **backend-driven columns and filters**, reusable interfaces, and **OpenSearch** for scalable ticket search and flexible dashboard configuration.
- Identified and fixed **silent production failure** in asynchronous ticket creation, where missing channel creation caused tickets to fail without errors; implemented an automatic **default-channel fallback**.

Samsung Research and Development

June 2025 – Dec 2025

Software Engineer

- Developed **low-level, high-performance C/C++ modules** for on-device ML model compilation targeting NPUs and simulators, working with LLVM, TVM, and Glow to improve compilation speed and inference performance.
- Integrated and tested ML frameworks including **TensorFlow and TensorFlow Lite** to ensure efficient deployment and runtime stability on embedded and edge devices.

Unbiass

June 2024 – June 2025

Lead Software Engineer

- **Architected a compiler cluster** with concurrent job handling for secure, scalable code execution, using Redis to manage long-running compiler calls and track client state reliably.
- Built the platform's **core cheating-detection engine** (first prototyped as [LC Police](#)) as a multi-LLM pipeline that uses LLMs (Llama, Mistral, Gemma via Groq) to strip deliberately-inserted junk code, normalize it, then build and compare syntax trees across submissions to catch plagiarism at **~98% accuracy**.
- Designed an aggregation algorithm that brought response times down to **as low as 25 ms**.

PROJECTS

SlimUUID | [Go](#)

[GitHub](#) | [Blog](#)

- Built and published a go get-installable **18-character unique identifier**, more compact than Google UUID (36 chars) and NanoID (21), **cutting index size by ~50%**.
- Combined nanosecond-precision timestamps with xxHash64 over MAC/IP and an atomic global counter, **keeping collision probability to ~0.000056%** and enabling safe ID generation across distributed systems.

SKILLS

Technical: C, C++, Java, Go, JavaScript, Node.js, Express.js, Gin, React.js, PostgreSQL, MongoDB, Redis, Datadog
Coursework: Data Structures, Algorithms, Object-Oriented Programming, Low Level Design, System Design

EDUCATION

JC Bose University, YMCA

2021 – 2025

Computer Engineering with Specialization in Data Science

ACHIEVEMENTS

- **Grew LC Police to ~2,500 daily active users** per contest over 2 months with **~100k reach**.
- **AIR 245 and 92** in Codeforces Rounds 920 and 928 (38,000+ participants); **2nd and 6th in TLE Eliminator 8.0**.
- **LeetCode 1800+ (Knight, Top 5% globally); Codeforces max rating 1550+ (Specialist)**.
- **Won INR 1.5L at the company hackathon** for building a GenAI + Selenium automation that reduced repetitive validation effort by **~80%**.
